

CHARACTERISTICS OF SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM HOUSEHOLDS: FISCAL YEAR 2014 (SUMMARY)

Background

In Fiscal Year (FY) 2014, about 46.5 million people living in nearly 22.7 million U.S. households participated in the USDA Supplemental Nutrition Assistance Program (SNAP), on average, per month.

SNAP households are a diverse group. Because benefits are available to most low-income households with few resources, regardless of age, disability status, or family structure, participants represent a broad cross-section of the Nation's poor. This report provides information about the demographic and economic circumstances of SNAP households in FY 2014.

General Characteristics

Nearly two-thirds percent of SNAP participants were children, elderly, or had disabilities. Forty-four percent of participants were under age 18, 10 percent were age 60 or older, and 10 percent were disabled nonelderly adults.

Most SNAP households live in major metropolitan areas, but a substantial number live outside of them. Nearly 82 percent of SNAP households live in or near large cities, while about 10 percent live in or near smaller cities and towns and about 7 percent live in rural areas.

Many SNAP participants had jobs. About 31 percent of SNAP households had earnings in 2014 and nearly 43 percent of all SNAP participants lived in a household with earnings.

The majority of SNAP households did not receive cash welfare benefits. Only 6 percent of all SNAP households received Temporary Assistance for Needy Families (TANF) benefits, and only 3 percent received State General Assistance (GA) benefits. Nearly 25 percent of SNAP households received Social Security, and 20 percent received Supplemental Security Income (SSI) benefits given to the aged and disabled.

SNAP households had little income. Nearly 22 percent of SNAP households had no cash income of any kind in the month the data was collected. Only 16 percent had gross income above the poverty line, while 43 percent had income at, or below, half the poverty line. The average SNAP household income was slightly less than 58 percent of the poverty line. The average gross income for all SNAP households was \$759 per month. For a SNAP household with the average gross income, 25 percent of monthly funds (gross income plus SNAP benefits) came from SNAP.

The average monthly benefit received by SNAP households was \$253, as compared to \$275 in 2013. This decrease reflects in part the reduction in benefits resulting from the expiration of the Recovery Act. Forty-two percent of SNAP households received the maximum benefit for their family size. Only 6 percent received the minimum benefit (\$15) available to households with one or two members.

Most SNAP households were small. Just over half of SNAP households contained only one person. The average SNAP household size was 2.0 persons, but varied considerably by household composition. Households with children were larger, averaging 3.2 members, while households with elderly participants were smaller, averaging 1.3 members.

SNAP has a powerful antipoverty effect. When SNAP benefits are added to gross income, 10 percent of SNAP households move above the poverty line. The impact is even greater on the poorest households, moving 13 percent of them above 50 percent of the poverty line.

Changes Over Time

Notable changes in the characteristics of SNAP participants in the last 25 years include:

The primary form of income among SNAP participants shifted from welfare to work. In

1989, nearly 42 percent of all SNAP households received cash welfare benefits and less than 20 percent had earnings. In 2014, only 6 percent received cash welfare, while 31 percent had earnings.

The percentage of households with no cash income of any kind tripled. The percent of households with zero gross income has gone from 7 percent in 1989 to 22 percent in 2014. The percentage of SNAP households with zero net income rose more than two-fold, from 18 percent in 1989 to 41 percent in 2014.

SNAP households have gotten smaller. In 1989, the average household size was 2.6 persons. In 2014, the average had fallen to 2.0 persons. Households with only one person accounted for half the caseload (52 percent) in 2014.
